Rinella et al. *Annals of Hepatology* 2023

# Definition

Affirmative set of diagnostic criteria for MASLD.

Near universal agreement to err on side of being inclusive

Minimize patient heterogeneity and be adaptable to future insights

Simple, readily available and easily measurable parameters

The diagnostic criteria were also selected to align with cardiometabolic risk factors already well established and validated in other metabolic health disorders

The set of criteria for adults was then submitted to a subcommittee of five pediatric hepatologists who adapted them for the pediatric population

# MASLD diagnostic criteria

Steatosis or  
undergoing  
evaluation for  
suspected  
steatosis

+

One or more of the following in the presence of confirmed or suspected hepatic steatosis

- **Diabetes/pre-diabetes:** Fasting serum glucose  $\geq 100$ mg/dL or 2-hour post load glucose levels  $\geq 140$ mg/dL or HbA1c  $\geq 5.7\%$  or type 2 diabetes or anti-diabetic treatment
- **Central obesity:** BMI  $> 25$  kg/m<sup>2</sup> (23 Asia) or waist circumference  $>94$  cm (M), 80cm (F) or ethnically adjusted for Asian populations
- **Hypertension:** Blood pressure  $> 130/85$  mmHg or use of antihypertensive therapy
- **Metabolic dyslipidemia**
  - Plasma triglycerides  $\geq 150$  mg/dL or use of lipid lowering therapy
  - Plasma HDL-cholesterol  $\leq 40$  mg/dL (M), or  $\leq 50$  mg/dL (F) or use of lipid lowering therapy

# Summary of (selected) key concepts to guide clinical practice:

## *Pearls for the assessment of MASLD*

- *Aminotransferase levels are frequently normal in patients with advanced liver disease due to MASH and should not be used in isolation to exclude the presence of MASH with clinically significant fibrosis.*
- *Normative values for ALT reported by most laboratories exceed what is considered a true normal. As a general rule, ALT>30U/L should be considered abnormal.*
- *While standard ultrasound can detect hepatic steatosis, it is not recommended as a tool to identify hepatic steatosis due to low sensitivity across the MASLD spectrum.*
- *CAP or MRI-PDFF may be used to detect steatosis, though MRI-PDFF can accurately quantify hepatic steatosis.*

# MASLD

## Natural History

# Patients with MASLD Are Twice as Likely To Die of Heart Attack and Stroke

Statins should be started when indicated

The diagram illustrates the progression of liver fibrosis through four stages, each represented by a histological image and associated risk levels. A vertical red bar on the left marks the stages. A large bracket on the right groups Stages 3 and 4 under the heading 'Clinically significant fibrosis'.

Stage	Image Label	Risk Level
Stage 1	(No label)	Low risk
Stage 2	(No label)	Clinically significant fibrosis Moderate risk
Stage 3	E	
Stage 4 Cirrhosis	F	

**Clinically significant fibrosis**  
Moderate risk

**Advanced fibrosis**  
High risk

**Weill**

# FIB-4 performance may be suboptimal in some patient populations

Diabetes

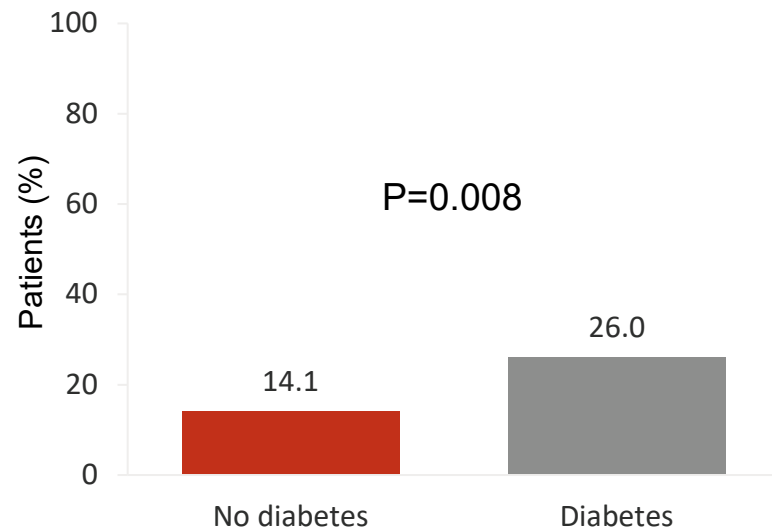

Race/ethnicity

Age>65

# Fibrosis progression in diabetic versus non-diabetic patients with biopsy-proven MASLD: Multi-center prospective study

Progression to advanced fibrosis

Presence of T2DM is associated with more rapid progression of MASLD

Fibrosis progression by  $\geq 1$  stage

Number at risk

196	124	85	38	11	6	1
231	172	115	74	38	23	7

Cumulative incidence (95% CI)

	T2DM	No T2DM
4 years	0.24 (0.18, 0.31)	0.20 (0.14, 0.26)
8 years	0.60 (0.47, 0.73)	0.50 (0.41, 0.59)
12 years	0.93 (0.76, 0.99)	0.76 (0.64, 0.87)
Adjusted HR	1.69 (1.17, 2.43); P=0.005	

# Screening for advanced fibrosis in high-risk populations

Prevalence of advanced fibrosis in background MASLD population (0.9-2%) <sup>20-23</sup>

Screening recommended	Prevalence of advanced fibrosis
Type 2 diabetes mellitus (T2DM)	6-19% <sup>1-8</sup>
Medically complicated obesity	4-33% <sup>9-17</sup>
MASLD in context of moderate alcohol use	17% <sup>18</sup>
First degree relative of a patient with cirrhosis due to NAFLD	18% <sup>19</sup>

## Rationale

- Populations enriched with advanced fibrosis
- Delayed diagnosis increases morbidity, mortality and cost
- Off-label use of available medications with mortality benefit (non hepatic) and probable benefit on NAFLD based on Ph2 trials

Share

The Fibrosis-4 score helps to estimate the amount of scarring in the liver. Enter the required values to calculate the FIB-4 value. It will appear in the oval on the far right (highlighted in yellow).

Age (years)

65

x

AST Level (U/L)

100

FIB-4 =

Platelet Count (10<sup>9</sup>/L)

240

x

ALT (U/L)

100

=

2.71

Interpretation:

Using a lower cutoff value of 1.45, a FIB-4 score <1.45 had a negative predictive value of 90% for advanced fibrosis (Ishak fibrosis score 4-6 which includes early bridging fibrosis to cirrhosis). In contrast, a FIB-4 >3.25 would have a 97% specificity and a positive predictive value of 65% for advanced fibrosis. In the patient cohort in which this formula was first validated, at least 70% patients had values <1.45 or >3.25. Authors argued that these individuals could potentially have avoided liver biopsy with an overall accuracy of 86%.

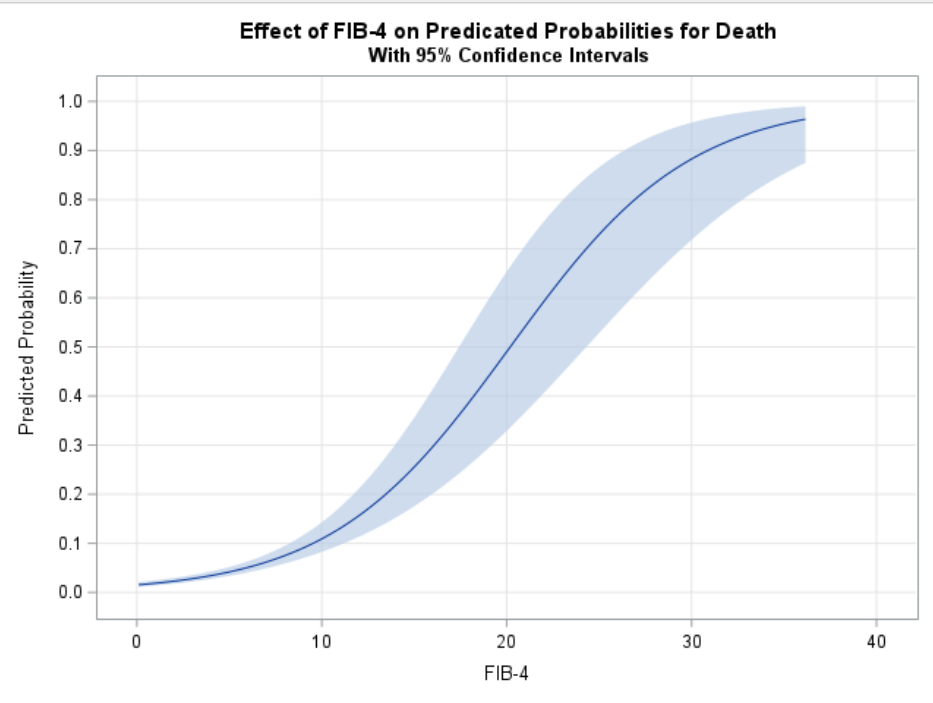

<1.45 90% NPV advanced fibrosis

# A prospective validation of FIB4 to predict death in MASLD

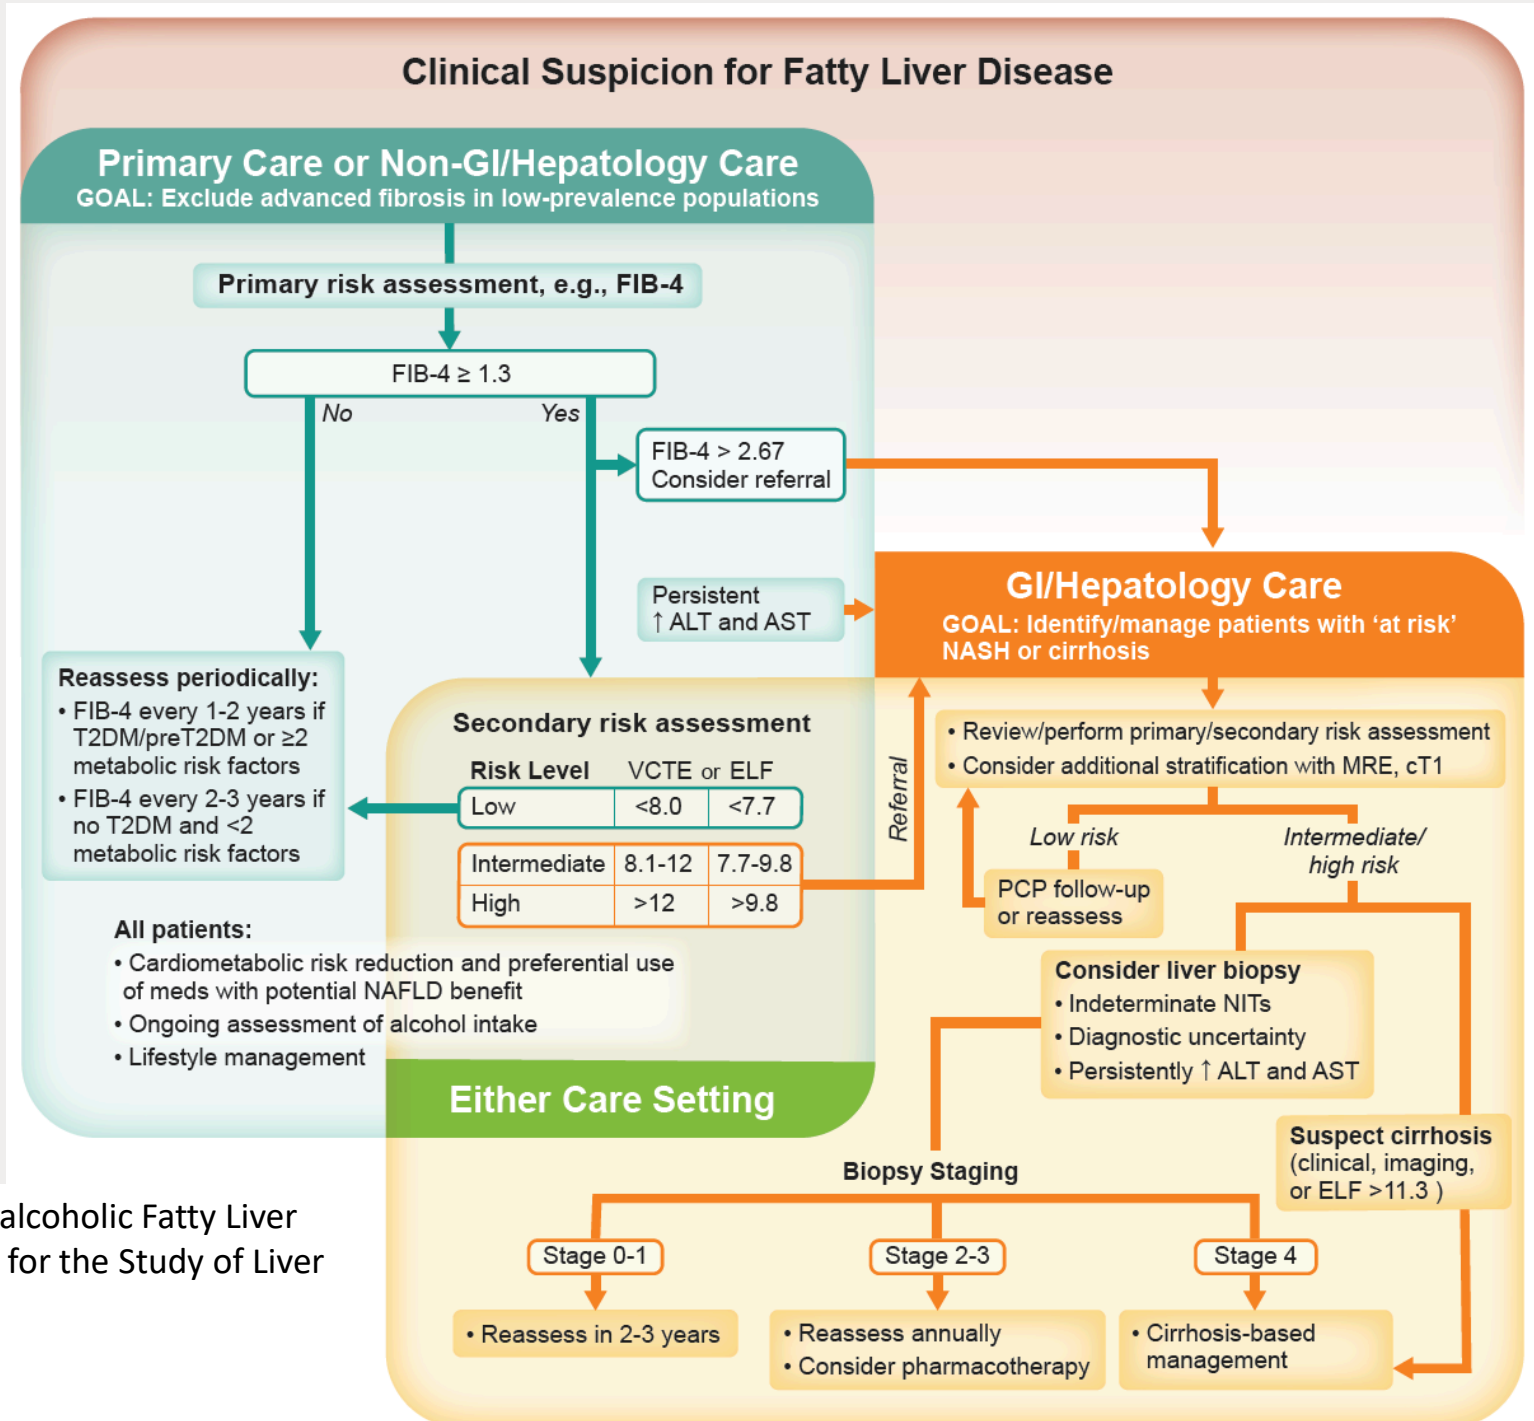

Incidence rate (per 100 person years) by risk classification at baseline

	Included Using FIB4 and/or LSM Criteria		
Rate per 100 person yrs	Class A (n=554)	Class B (n=536)	Class C (n=846)
Deaths *	0.07	0.42	3.08
Liver events *	0.21	1.32	9.33
MACE *	0.83	1.60	2.54
HCC *	0	0.07	1.08

N= 2523 (median follow up 3 years)

- Class A: FIB4 < 1.3, LSM < 8kPa
- Class B: FIB4 1.3-2.6, LSM 8-12.5 kPa or class A FIB4/LSM but with AST:ALT > 1, platelet < 150k
- Class C: FIB 4 > 2.6, LSM > 12.5 kPa

# ELF for prognostication in MASH

## NASH and bridging fibrosis (n=219)

### Progression to Cirrhosis According to Baseline ELF

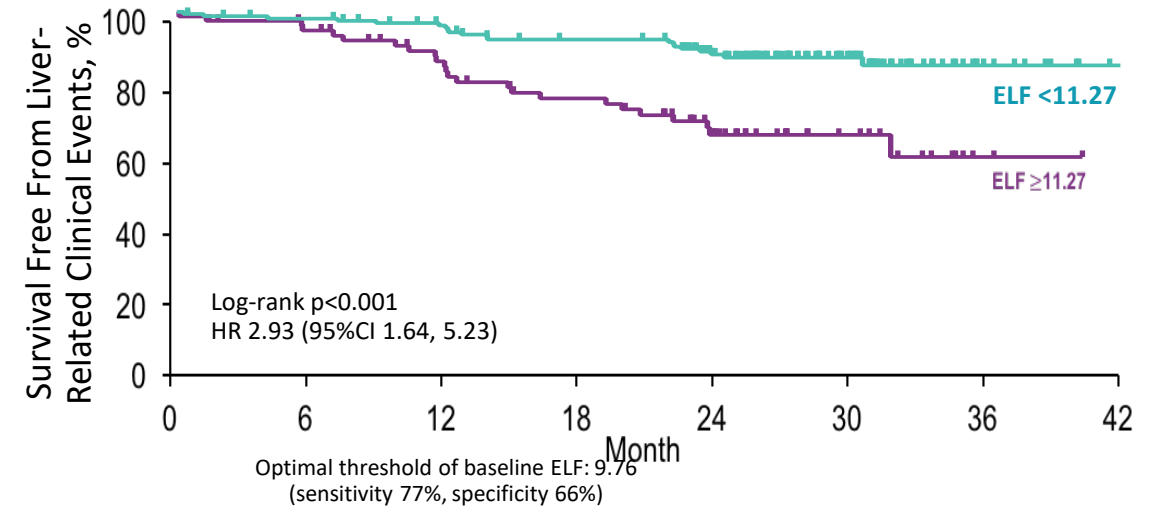

### Predictors of Progression to Cirrhosis

Parameter	Adjusted HR (95% CI)	P-value
Baseline ELF	3.20 (2.33, 4.39)	<0.001
Change in ELF	1.60 (1.19, 2.16)	<0.01
Ishak stage 4 vs 3	0.87 (0.47, 1.59)	0.64

## Compensated cirrhosis (n=258)

### Liver-Related Clinical Events According to Baseline ELF

Parameter	Adjusted HR (95% CI)	P-value
Baseline ELF	2.40 (1.70, 3.38)	<0.001
Change in ELF	1.53 (1.09, 2.14)	0.01
Ishak stage 6 vs 5	0.89 (0.47, 1.68)	0.71

**A unit change in ELF is associated with a doubling of risk of liver-related outcome.**

Higher baseline ELF and greater change in ELF were associated with liver-related clinical events

# Imaging to Assess MASH Fibrosis: Elastography

## Vibration controlled transient elastography (*FibroScan*)

Accurate in detecting advanced fibrosis

Predicts risk of decompensation and complications

Correlates fairly well with portal pressure

Most reliable in ruling out advanced disease

Most widely used

## Shear wave elastography (SWE)

Uses acoustic radiation force impulse (ARFI) technology

Point quantification SWE or 2-D supersonic shear imaging (SSI) SWE

## MR elastography

Most accurate of the imaging modalities

Costly, no point-of-care access

# Prime Culprit in MASLD is High Fructose Corn Syrup

# De novo Lipogenesis

- No regulation of liver uptake
- No regulation of conversion to fat
- No increase in leptin

# Weight Loss and Exercise Cornerstone of Treatment of MASLD

- Up to 3-5% weight loss improves steatosis
- Up to 7-10% weight loss has been associated with significant improvement in MASLD Activity Score

# Impact of lifestyle intervention and weight loss

†: 5-yr data

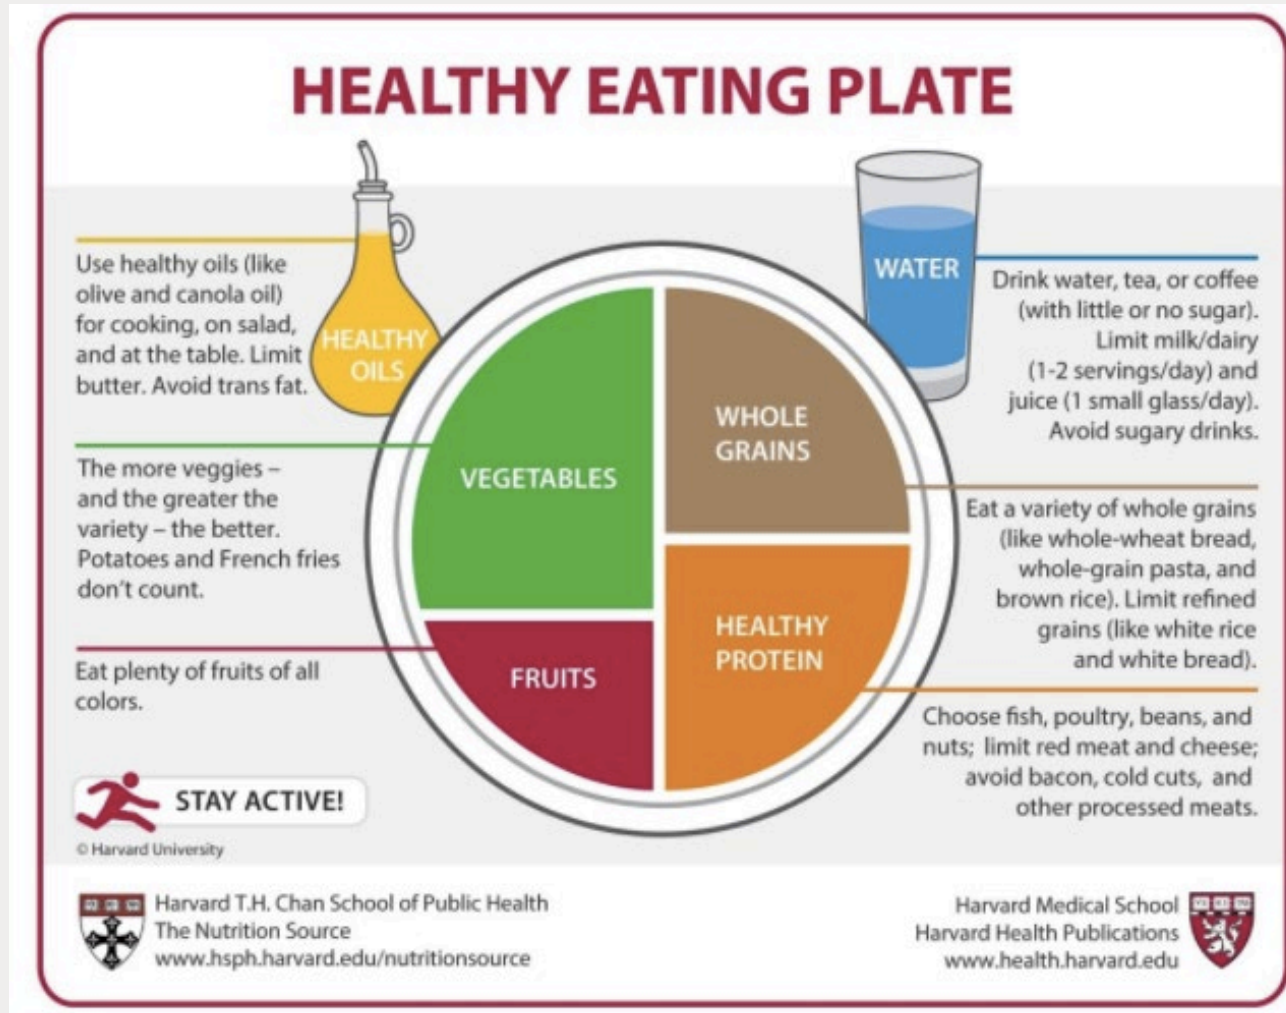

Vilar Gomez et al, *Gastroenterology* 2015 Aug;149(2):367-78; Lassailly et al. Bariatric Surgery Provides Long-term Resolution of Nonalcoholic Steatohepatitis and Regression of Fibrosis. *Gastroenterology* 2020

# Healthy Eating Should Be Cornerstone of Treatment

- Keep the focus positive
  - Goal is lifelong consistency
  - Not “Dieting”
- Limit simple sugars
- Use healthy oils and limited amounts
- Include protein in meals
- Mediterranean diet most studied but any reduced calorie diet may be similar
- Avoid large portions
  - Split restaurant meals

# Noninvasive markers of response

Placebo Resmetirom 80 mg Resmetirom 100 mg

Harrison et al. 2024, in press

# Combination Therapy for MASH

# Summary of (selected) key concepts to guide clinical practice:

## *Screening for advanced fibrosis and risk stratification*

- *General population-based screening for MASLD is not advised*
- *Hepatic steatosis, or suspected MASLD based on the presence of obesity and metabolic risk factors should undergo primary risk assessment with FIB-4.*
- *Patients with pre-DM, T2DM or  $\geq 2$  met risk factors (or steatosis on imaging): Repeat FIB-4 every 1-2 years, and when available, consider secondary fibrosis assessment*
- *If FIB-4  $\geq 1.3$ , VCTE, MRE or ELF, may be used to exclude advanced fibrosis.*

# Summary of (selected) key concepts to guide clinical practice:

## *Disease modifying interventions in patients with NAFLD*

- *Patients with NAFLD who are overweight or obese should be prescribed a diet that leads to a caloric deficit. When possible, diets with limited carbohydrates and saturated fat and enriched with high fiber and unsaturated fats (e.g. Mediterranean diet) should be encouraged due to their additional cardiovascular benefits.*
- *Patients with NAFLD should be strongly encouraged to increase their activity level to the extent possible. Individualized prescriptive exercise recommendations may increase sustainability and have benefits independent of weight loss.*
- *Bariatric surgery should be considered as a therapeutic option in patients who meet criteria for metabolic weight-loss surgery as it effectively resolves NAFLD or NASH in the majority of patients without cirrhosis and reduces mortality from CVD and malignancy*

# Summary of (selected) key concepts to guide clinical practice:

## *Alcohol and other considerations*

- *In patients with MASLD, alcohol can be a co-factor for liver disease progression and intake should be assessed on a regular basis.*
- *Patients with clinically significant hepatic fibrosis ( $\geq F2$ ) should abstain from alcohol use completely.*
- *Improvement in ALT or reduction in liver fat content by imaging in response to an intervention may indicate histological improvement in disease activity.*
- *First-degree relatives of patients with MASH cirrhosis should be counseled regarding their increased individual risk and offered screening for advanced hepatic fibrosis.*
